

Sobol sensitivity regime: direct effect and interaction share, by parameter (full box)

(a) no cable

(b) cable

■ direct effect S_1 ▨ interaction $S_T - S_1$ — 95% bootstrap CI on S_T

Bar length is the total effect S_T ; the segment boundary is how much of it acts directly. Parameters are sorted by S_T within each panel, so vertical order is the ranking. A cable's rest length cannot act on the other cable's tension, so it is omitted from those two panels rather than drawn as zero.
